Korra Memory Quick Start Guide

Filename: korra_memory_quickstart.md
Author: Professor Denis O. Núñez
Email: donunez@programmingjourneys.com
Organization: Programming Journeys
Project: Project 10 - Korra: Persistence and Streaming
Module: Module 10 - Memory System Organization
Layer: Deployment - Container
Date Created: October 11, 2026
Date Modified: October 11, 2026
Version: 2.1
License: Educational Use

📁 Required Files Checklist

- ✅ `.env` file with required API keys
- ✅ deeplearning.ai development environment
- ✅ Korra Fall 26 development environment
- ✅ Module 06 Docker homework assignment
- ✅ Module 06 Chatbot source code
- ✅ Module 08 tools
- ✅ Module 09 Korra source code
- ✅ Module 10 SQL source code

🔑 .env File Format

No spaces around the `=`.

Section	Needs
S1, S2	`OPENAI_API_KEY`, `TAVILY_API_KEY`
S3	`OPENAI_API_KEY`
S4	`OPENAI_API_KEY`, `POSTGRES_PASSWORD`, beside `docker-compose.yml`

```
OPENAI_API_KEY=sk-proj-xxxxxxxxxxxxxxxxxxxx
TAVILY_API_KEY=tvly-xxxxxxxxxxxxxxxxxxxx
POSTGRES_PASSWORD=choose_a_database_password
```

🧰 Before You Start

`langgraphfall26` for S01, `korrafall26` for S02 and S03. Not interchangeable.

S04 needs Docker. Check with `docker ps`.

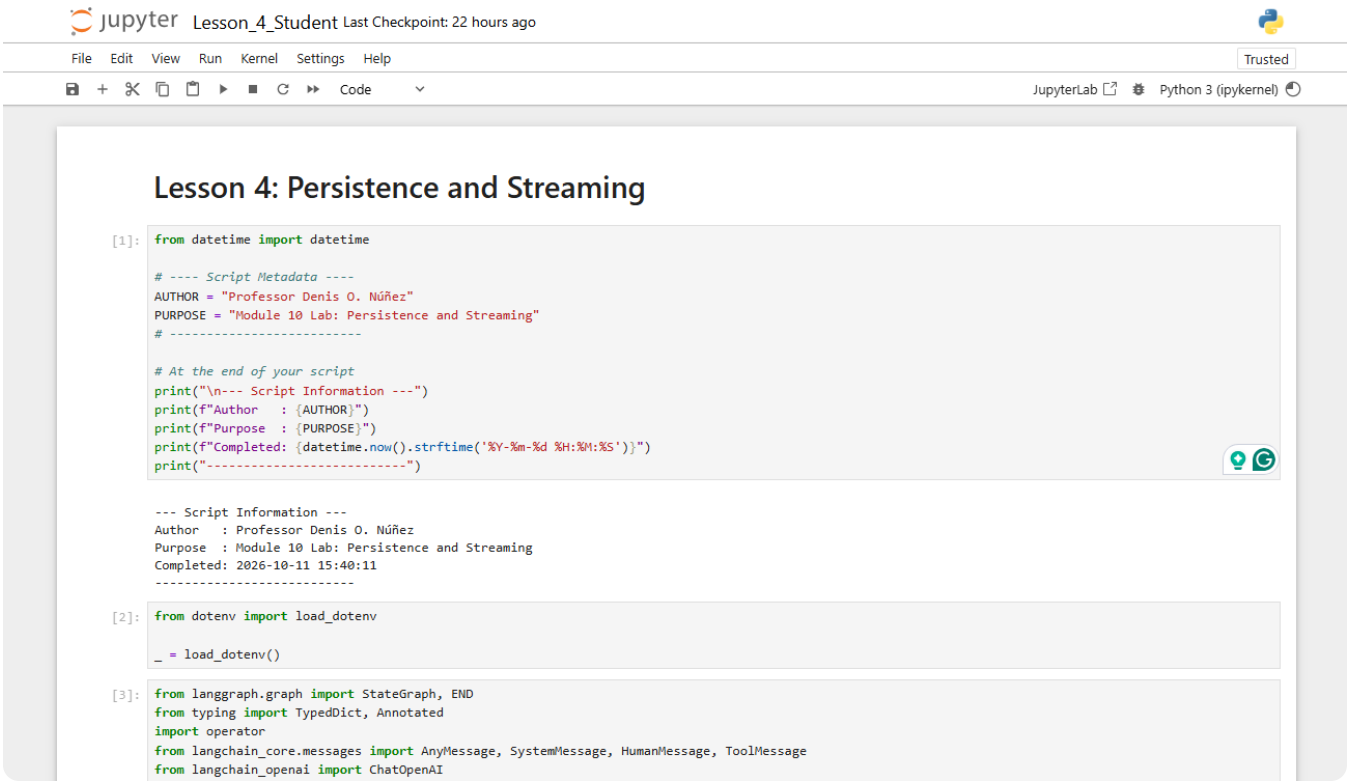

S03 and S04 both use port `2024`. Only one at a time.

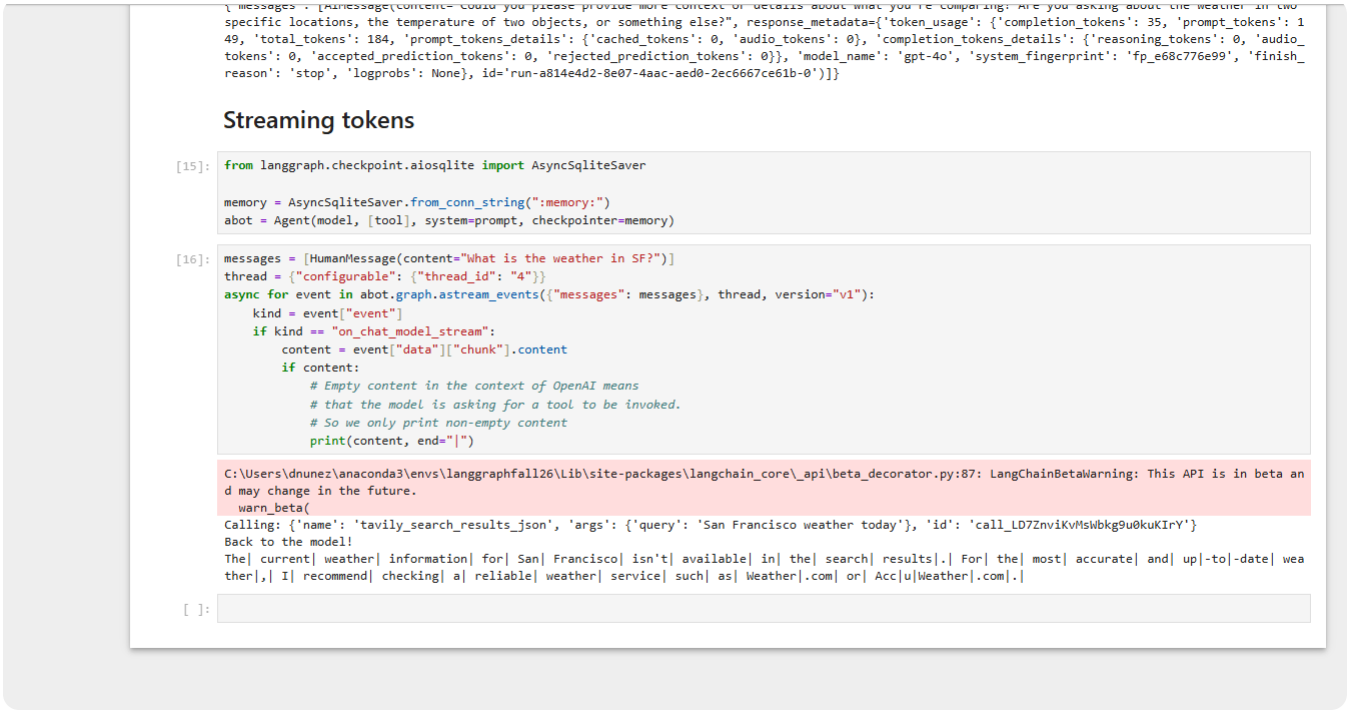

🧪 S01 Tests

From `S1`:

```
conda activate langgraphfall26
python -m notebook Lesson_4_Student.ipynb
```

Run the cells in order, including **Streaming tokens**.

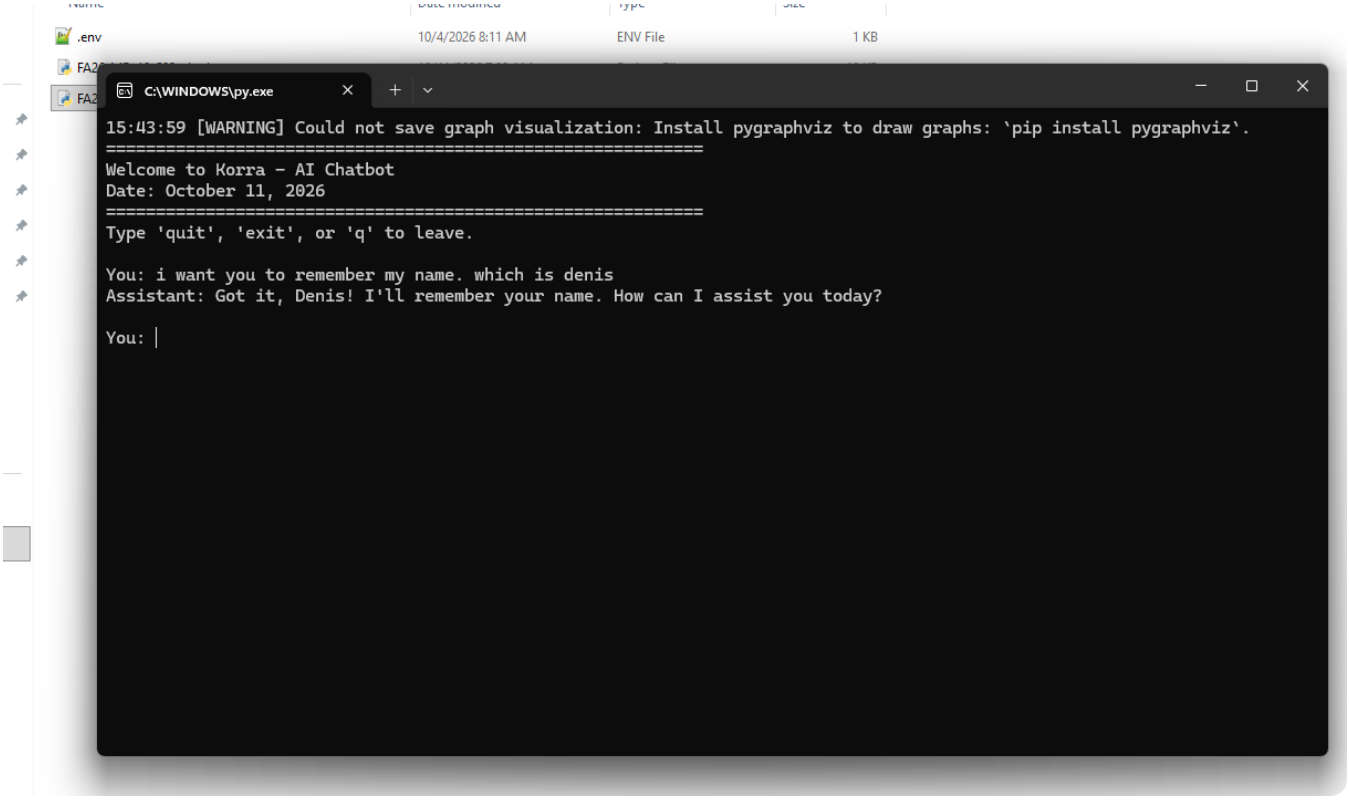

Thread `1` keeps the conversation. Thread `2` does not. The beta warning in red is not an error. Checkpoints are in memory, so a kernel restart clears them.

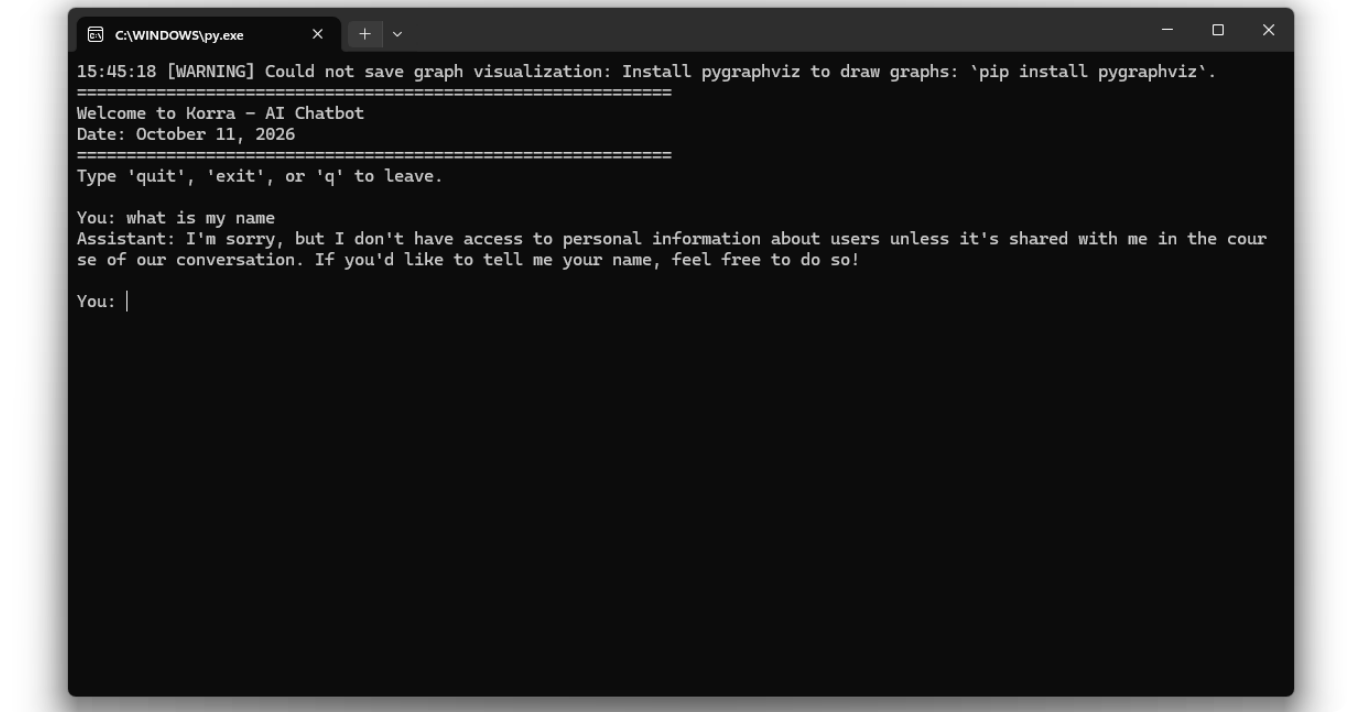

🧪 S02 Tests

From `S2`:

```
conda activate korrafall26
python FA26_MD_06_S03_chatbot.py
```

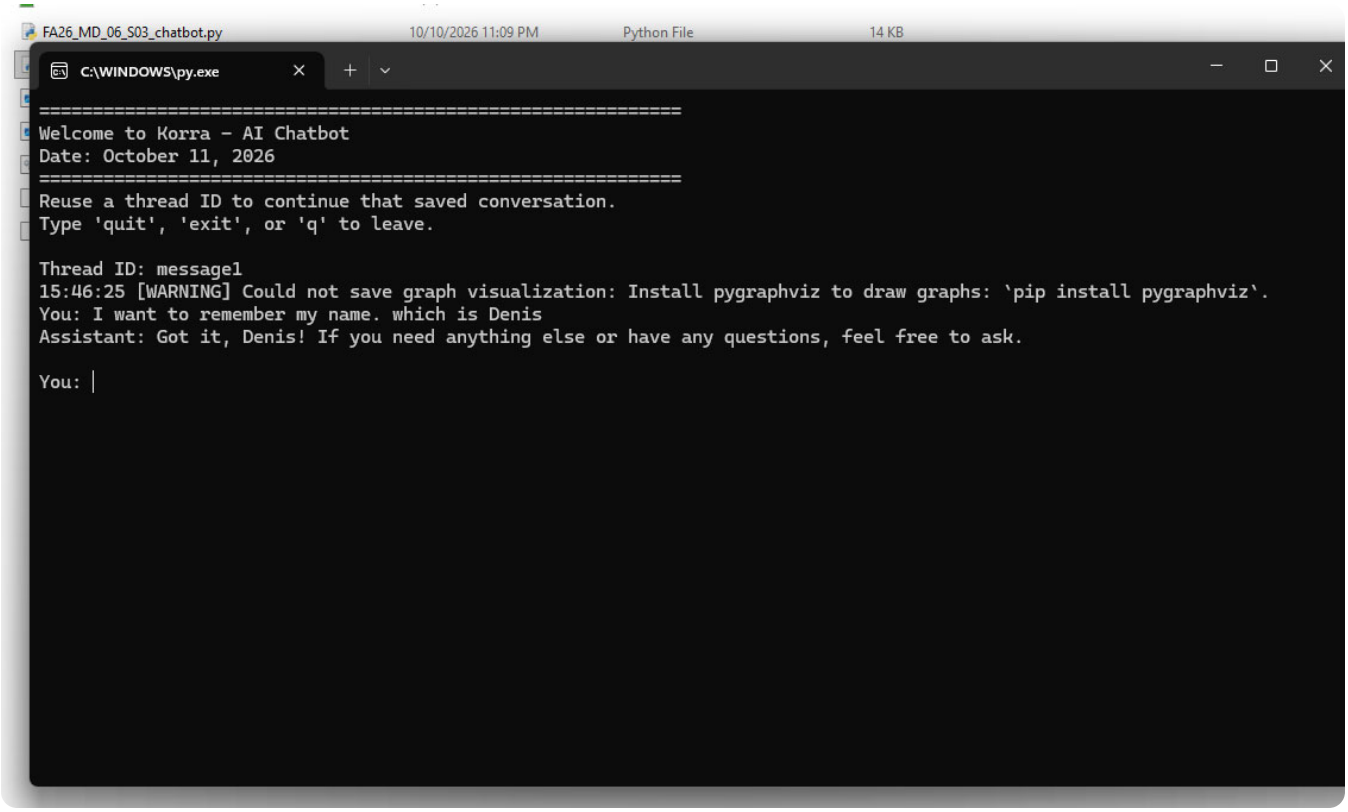

Say `i want you to remember my name. which is denis`, then `quit`. Run it again and ask `what is my name`.

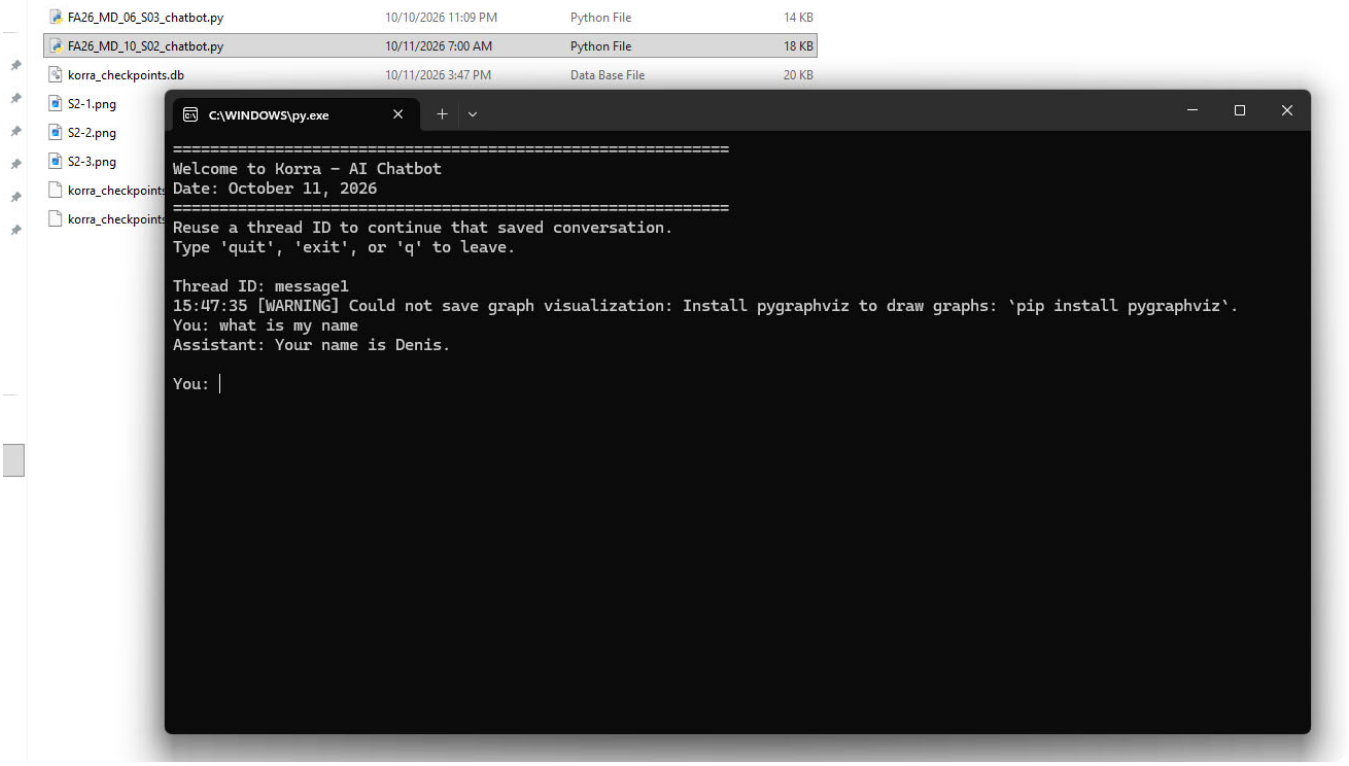

```
python FA26_MD_10_S02_chatbot.py
```

Thread ID `message1`. Same name, then `quit`. Run it again, same thread ID, and ask `what is my name`.

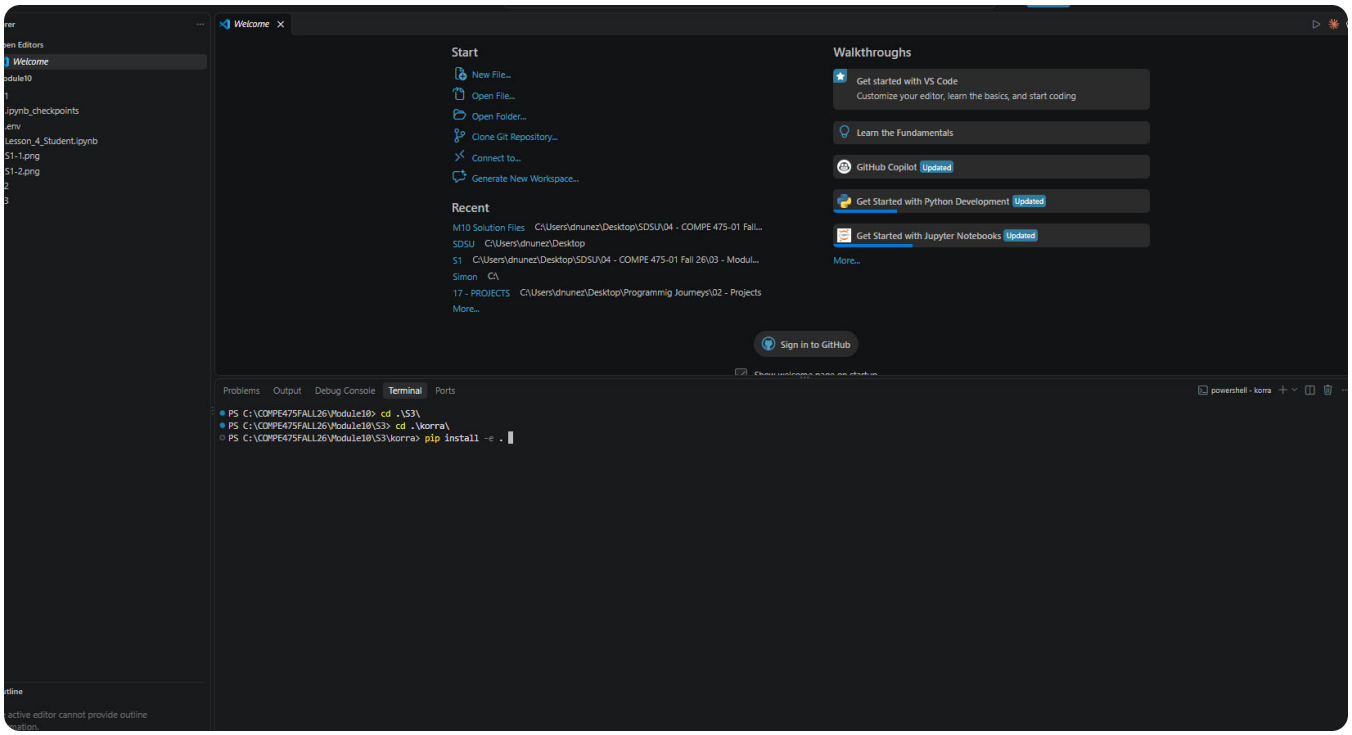

The conversation is in `S2/korra_checkpoints.db`. A different thread ID does not know the name. The graph-visualization warning is harmless.

🧪 S03 Tests

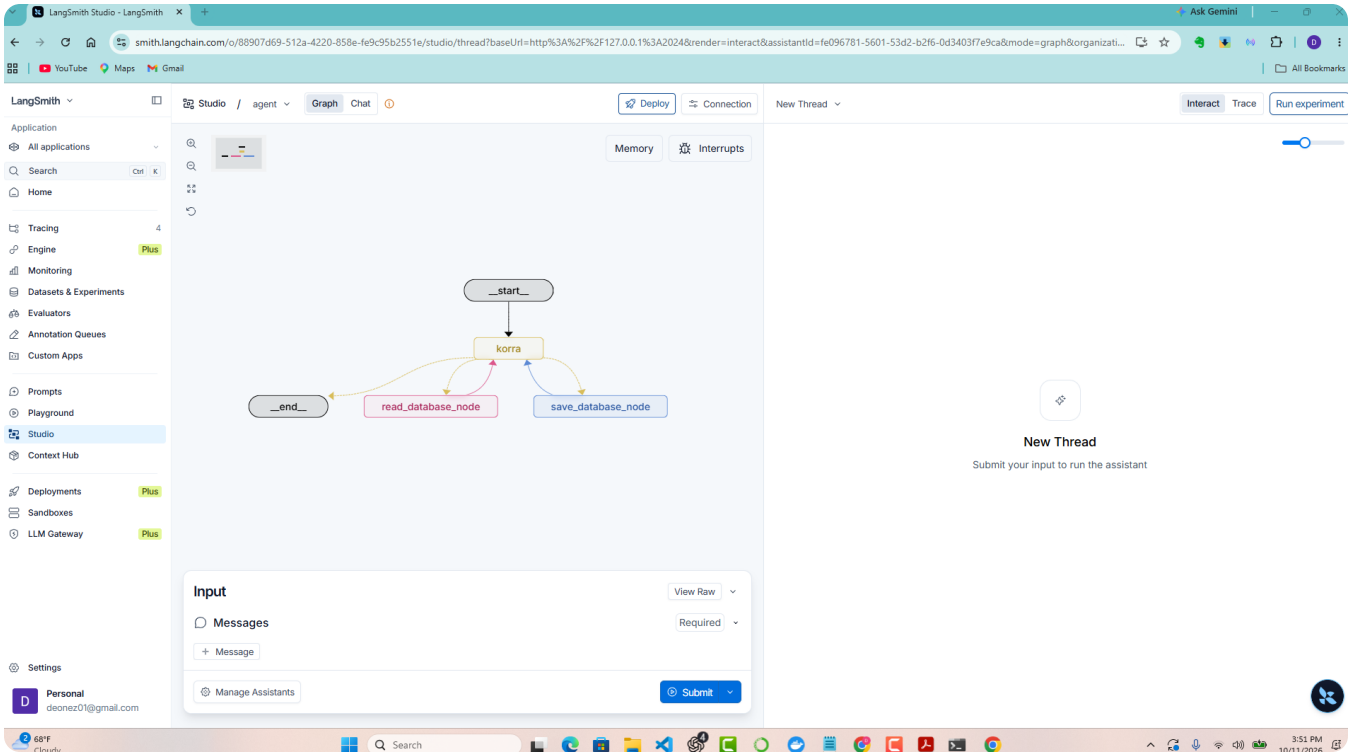

`test_database.db` from the lecture goes in `S3/korra/src/korra_m10/tools/`.
The tools do not create it.

From `S3/korra`:

```
conda activate korrafall26
python -m pip install -e .
```

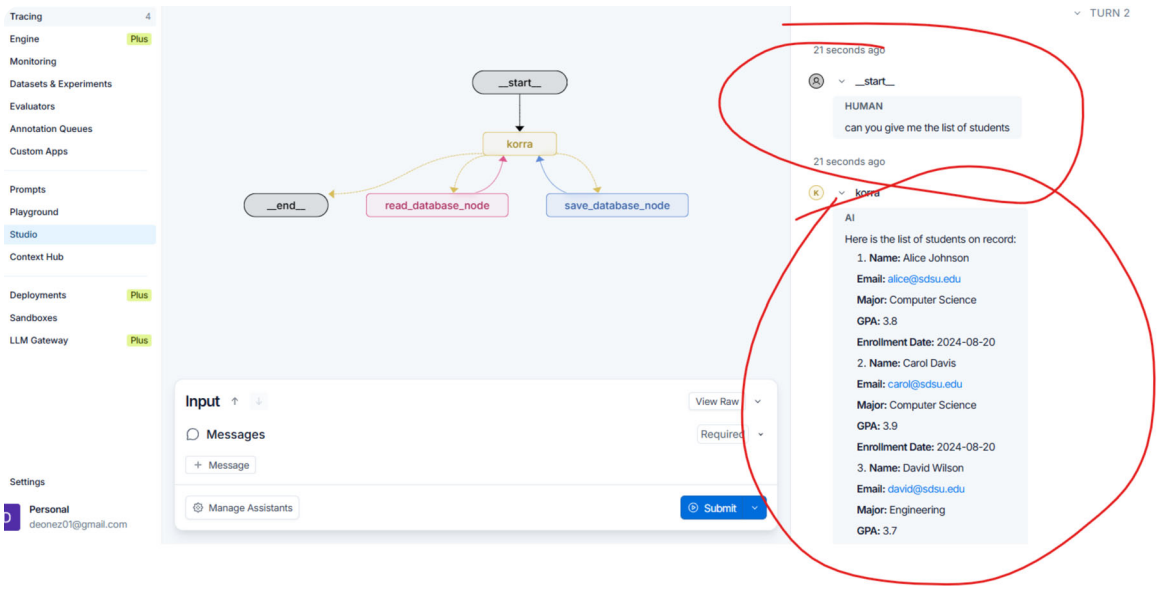

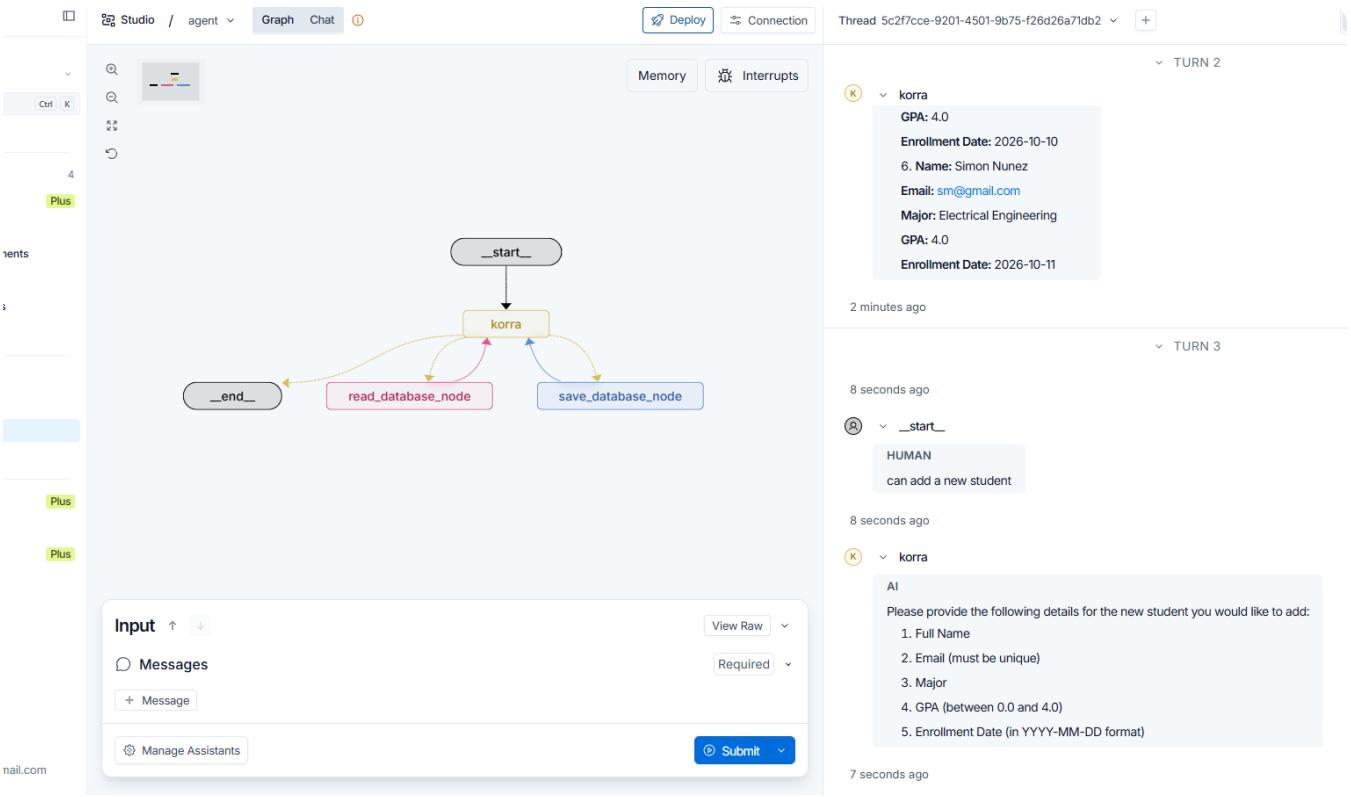

```
langgraph dev
```

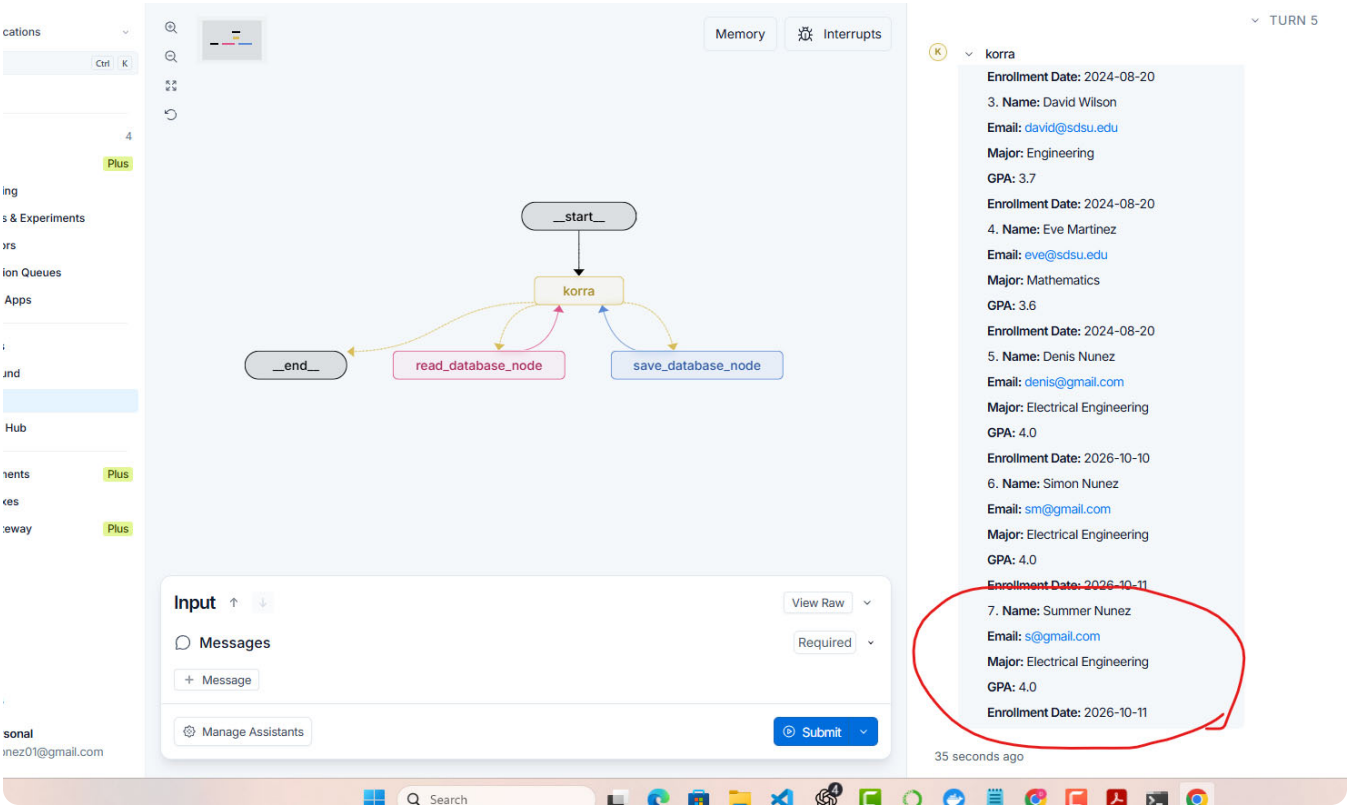

In Studio, one at a time:

```
can you give me the list of students
can you add a new student
```

Supply the details with a unique email, then ask for the list again.

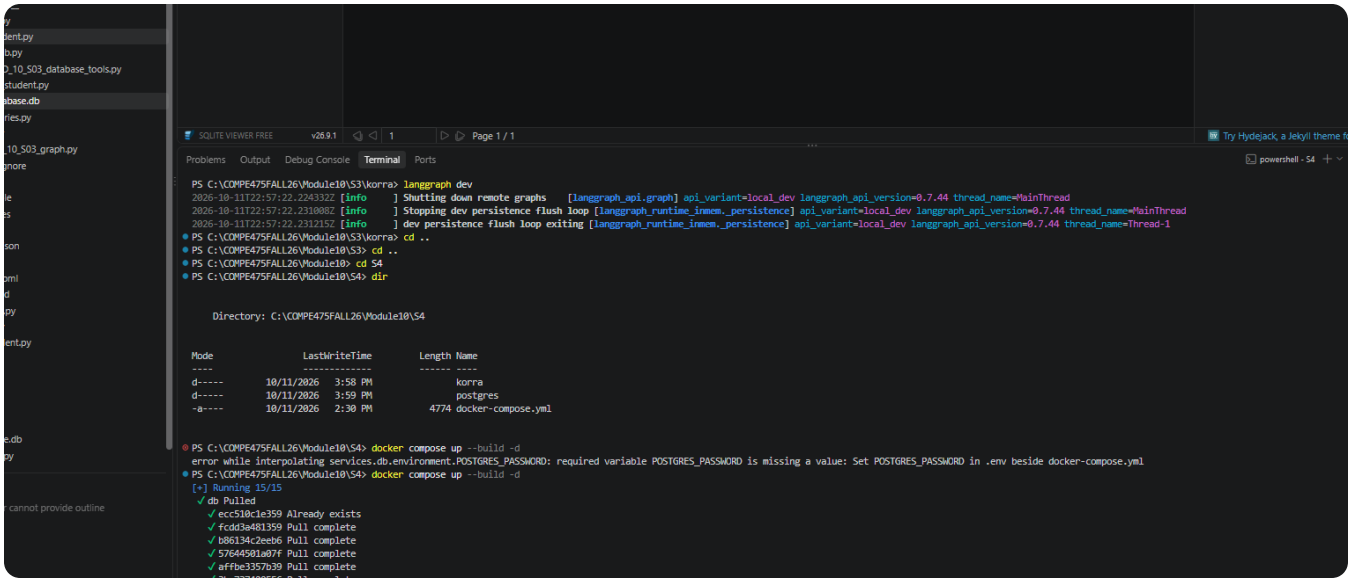

Saving does not enroll the student in a course, so the registration count does not change. The same email twice is refused. Stop the server with **Ctrl+C**,

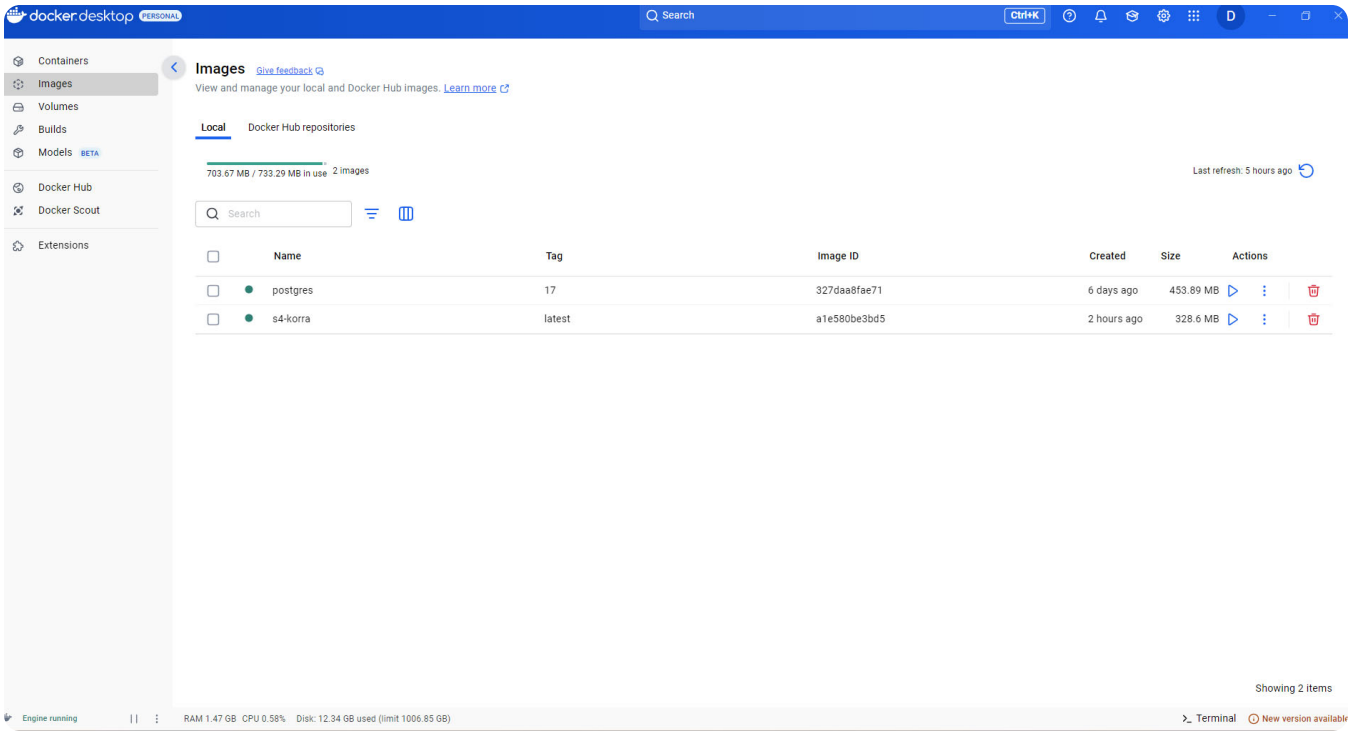

start it again, ask for the list: the student is still there.

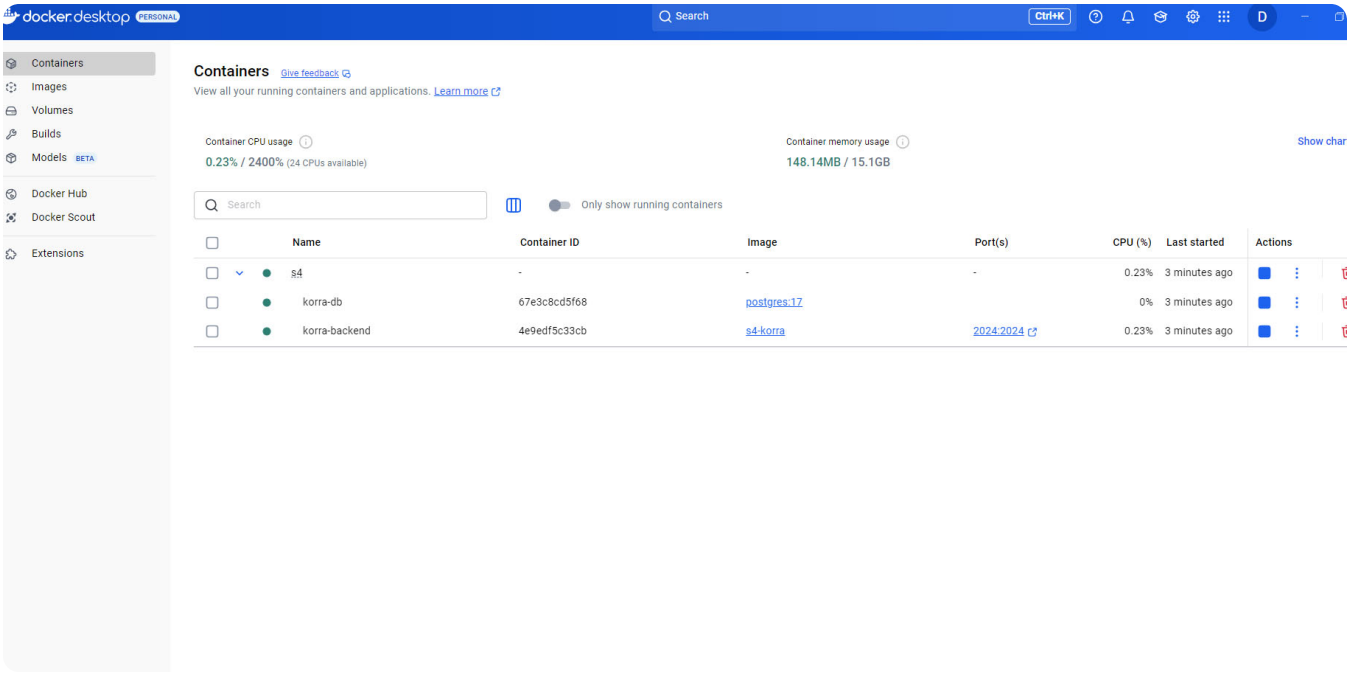

🧪 S04 Tests

From `S4`, with `.env` beside `docker-compose.yml`:

```
docker ps
docker compose up --build -d
docker compose ps
```

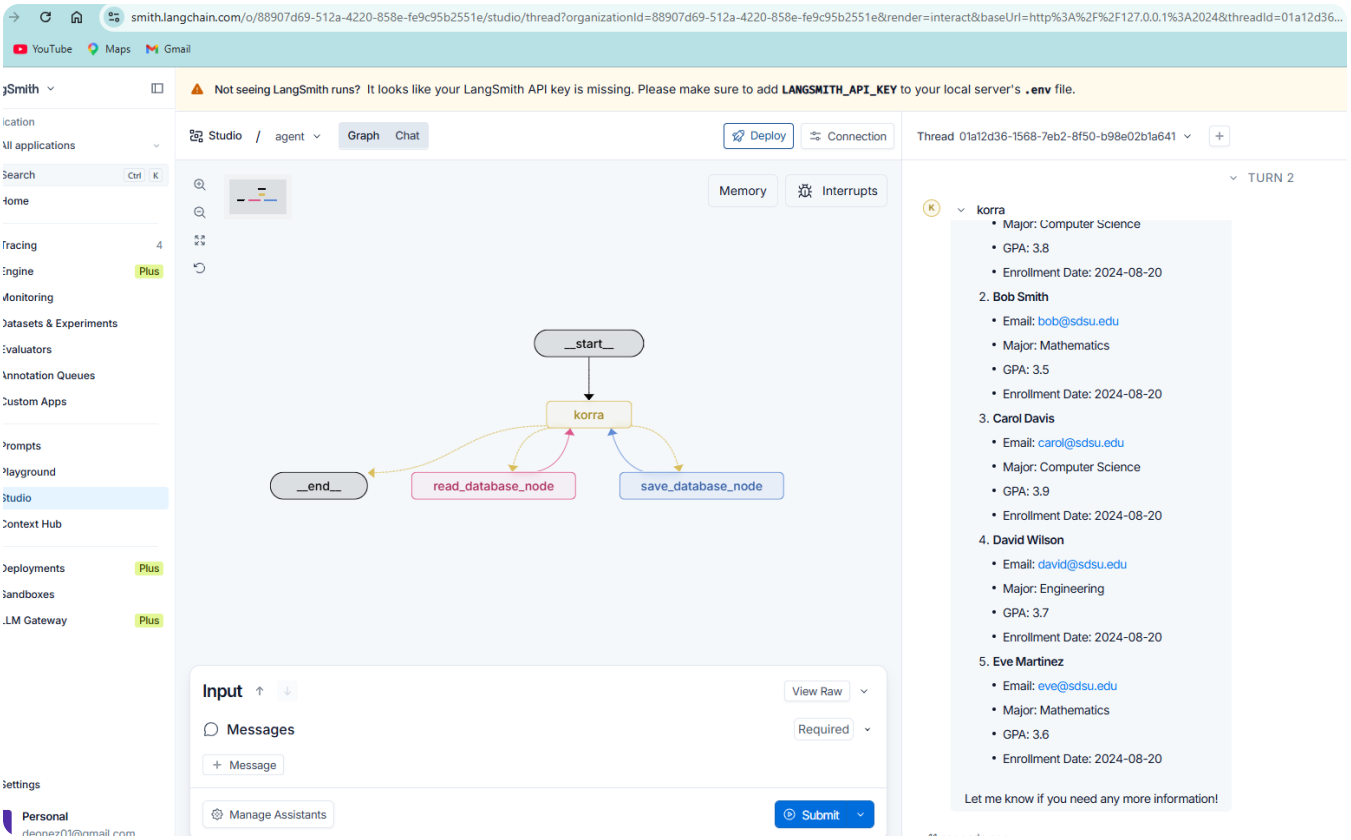

In Studio at https://smith.langchain.com/studio/?baseUrl=http://127.0.0.1:2024:

```
can you give me the list of students
```

A fresh volume holds 5 students, 5 courses and 10 registrations. S03's SQLite records are not imported.

Save a student with a unique email, then:

```
docker compose down
docker compose up -d
```

Ask for the list again. The student is still there. `down` keeps the records; `down -v` deletes them.

🚀 Everyday Commands

```
# S02: continue a saved conversation
python FA26_MD_10_S02_chatbot.py

# S03: start the server
langgraph dev

# S04: start, watch, stop
docker compose up --build -d
docker compose logs -f korra
docker compose down

# S04: look inside the database
docker compose exec db psql -U korra -d korra
```

🩺 When It Does Not Work

S01 import error in the streaming cell. Wrong environment. Use `langgraphfall26`.

Server cannot find `korra_m10`. Run `python -m pip install -e .` from `S3/korra`.

`POSTGRES_PASSWORD is missing a value`. Compose stopped before starting anything. Fix `.env` and run the command again.

`Ports are not available`, but something still answers on 2024. Ctrl+C left an S03 worker holding the port:

```
Get-CimInstance Win32_Process -Filter "Name='python.exe'" |
  Where-Object { $_.CommandLine -match 'korrafall26' -and $_.CommandLine -match 'multiprocessing' }
  ForEach-Object { Stop-Process -Id $_.ProcessId -Force }
```
